This book addresses health professions educational challenges specific to non-Western cultures, implementing a shifting paradigm for educating future health professionals towards patient-centered care. While health professions education has received increasing attention in the last three

decades, promoting student-centered learning principles pioneered by leaders in the medical community has, for the most part, remain rooted in the Western context. Building from Hofstede's analysis of the phenomena of cultural dimensions, which underpin the way people build and maintain their relationships with others and influence social, economic, and political well-being across nations, this book demarcates the different cultural dimensions between East and West, applied to medical education. The respective 'hierarchical' and 'collectivist' cultural dimensions are unpacked in several studies stemming from

non-western countries, with the capacity to positively influence healthcare education and services. The book provides new insights for researchers and health professional educators to understand how cultural context influences the input, processes, and output of health professionals' education. Examples include how cultural context influences the ways in which students respond to teachers, how teachers giving feedback to students, and the challenges of peer feedback and group work. The authors also examine causes for student hesitation in proposing ideas, the pervasive cultural norm of maintaining harmony, the challenges of teamwork in

clinical settings, the need to be sensitive to community health needs, the complexity of clinical decision making, and the challenge of how collectivist cultural values play into group dynamics. This book aims to advocate a more culturally-sensitive approach to educating health professionals, and will be relevant to both students and practitioners in numerous areas of public health and medical education. Clinical Procedures for Health Professions is the ideal multi-professional learning resource covering basic and advanced clinical procedures commonly encountered by practitioners and suited for both students and clinicians. Each procedure

is discussed in terms of rationales, evidence-based indications, contraindications, potential complications, special considerations, and step-by-step procedural instructions. The format is clear and organized, allowing students to fully grasp the most important elements of each procedure. Psychology: An Introduction for Health Professionals will appeal to the undergraduate nursing and health science student seeking to understand patient responses and behaviours to various diagnoses, interventions and health outcomes. Written by Patricia Barkway and Deb O'Kane, the text is divided into two sections. The first

introduces essential concepts and theories of psychology in the context of human development across the lifespan. The second focuses on applying these concepts and theories to healthcare issues and practice. Critical thinking questions encourage reflection on clinical practice Case studies provide clinical relevance Chapter 14 Psychology in Practice features discipline-specific case studies across 11 health disciplines Research focus examples in each chapter assist students to link research to clinical practice An eBook included in all print purchases Additional resources on Evolve eBook on VitalSource Instructor

Resources Image collection PowerPoint slides Test bank Answer Key—critical thinking questions Student resources: Glossary Student practice questions Discipline-specific case studies This collection provides a research-based guide to instructional practices for writing in the health professions, promoting faculty development and bringing together perspectives from writing studies, technical communication, and health humanities. With employment in health-care sectors booming, writing instruction tailored for the health professions is in high demand. Writing instruction is critical in the health professions because

health professionals, current and aspiring, need to communicate persuasively with patients, peers, mentors, and others. Writing instruction can also help cultivate professional identity, reflective practice, empathy, critical thinking, confidence, and organization, as well as research skills. This collection prepares faculty and administrators to meet this demand. It combines conceptual development of writing for the health professions as an emergent interdiscipline with evidence-based practices for instructors in academic, clinical, and community settings. Teaching Writing in the Health Professions is an essential

resource for instructors, scholars, and program administrators in health disciplines, professional and technical communication, health humanities, and interdisciplinary writing studies. It informs the teaching of writing in programs in medicine, nursing, pharmacy and allied health, public health, and other related professions. Medical care is an industry and private providers and hospitals are the major service providers. They operate on business principles. Hospitals are getting highly specialized and complex. The diagnostics and therapeutics are technology intensive. Private establishments have to

compete with one another to remain in business. They strive to induct the best talent and latest technical know-how, resulting in ever-increasing costs to patients. Patients, who pay high charges, demand quality as a matter of right. To meet the challenge, hospitals are constrained to bring in professionalism in their systems and services. They appoint qualified professional managers to manage their clinics and hospitals with a view to sparing health professionals to focus on clinical care. Whether right or wrong, 'management' is often associated with authority and power. As a result, the medical professionals are reduced to

secondary level in some organizations. To retain commanding positions in medical organizations, it has become necessary for the healthcare professionals to learn 'management', at least its basics. On the other hand, non-medical managers while managing healthcare services do not get the required cooperation from the medical professionals, as the latter are often secretive and not willing to share medical knowledge. If medical knowledge is demystified, non-medical managers can perform many functions in healthcare organizations proficiently. Both medical and non-medical managers can complement

each other in providing quality healthcare services. The book aims to orient clinicians (including physicians and nurses) and other healthcare professionals on the essentials of business management and to familiarize them with management terms and jargon. They can learn to be effective managers besides being health professionals. Similarly, non-medical managers can get familiarized to nuances of clinical care and special managerial requirements of healthcare facilities. They all will be able to relate processes in healthcare settings with the concepts of business management. They can develop expertise on patient

relationship management The World Health Organization defines the social determinants of health as "the conditions in which people are born, grow, work, live, and age, and the wider set of forces and systems shaping the conditions of daily life." These forces and systems include economic policies, development agendas, cultural and social norms, social policies, and political systems. In an era of pronounced human migration, changing demographics, and growing financial gaps between rich and poor, a fundamental understanding of how the conditions and circumstances in which individuals and populations exist affect mental

and physical health is imperative. Educating health professionals about the social determinants of health generates awareness among those professionals about the potential root causes of ill health and the importance of addressing them in and with communities, contributing to more effective strategies for improving health and health care for underserved individuals, communities, and populations. Recently, the National Academies of Sciences, Engineering, and Medicine convened a workshop to develop a high-level framework for such health professional education. A Framework for Educating

Health Professionals to Address the Social Determinants of Health also puts forth a conceptual model for the framework's use with the goal of helping stakeholder groups envision ways in which organizations, education, and communities can come together to address health inequalities. Self-Care for Allied Health Professionals brings together a collection of self-care strategies into one easy-to-read volume, supporting Allied Health Professionals to do the best for their patients by caring for themselves. constructivism, connectivism, transformative learning, and quantum learning theory. The authors also address other issues familiar to those who have taught online courses. How can a distance instructor build teacher-student relationships? How does one create a sense of community in the virtual classroom? How can an online instructor best support students in their future pursuit of knowledge and their development as competent professionals?
