Progress in Total Synthesis Nov 24 2022 This series stemmed from a group of weekly seminars in our research group aimed at keeping its members abreast of recent developments in organic synthesis. The seminars tended to consist of several syntheses of natural products or related systems with particular emphasis on the general strategy inherent in the effort, new and interesting reactions which were utilized in the work, and specificity (or the lack of it) in arranging the relative stereochemistry of asymmetric centers and the geometry of double bonds. We found that natural products offered an attractive setting in which the larger science of organic chemistry could be put to crucial tests. A truly elegant synthesis is a major advance in that it epitomizes how an imaginative mastery of the course of organic reactions can achieve a sophisticated objective by an economy of operations. Indeed any successful synthesis of a reasonably complex product, however cumbersome and graceless, is an important event for those who delight in the problem-solving dimension of science.

**The Total Synthesis of Natural Products** Dec 13 2021

**Strategies and Tactics in Organic Synthesis** May 26 2020 This account describes the total synthesis of the title compound, an antimetabolic bicyclic peptide. A first-generation approach involving right-hand ring formation followed by left-hand ring annulation was unsuccessful but yielded several interesting observations. A revised strategy was devised in which left-hand ring synthesis would precede right-hand macrocycle construction. A suitably functionalized tryptophan derivative was prepared via phase transfer-catalyzed asymmetric alkylation and Larock heteroannulation. A Knoevenagel condensation-radical

conjugate addition sequence fashioned the tryptophan-leucine cross-link, and macrolactamization furnished the left-hand ring. The concise, high-yielding nature of the route compensated for the low diastereoselectivity of the radical conjugate addition. Discovery of an NCS-promoted indole-imidazole oxidative coupling facilitated by proline benzyl ester enabled construction of the tryptophan-histidine cross-link, and right-hand macrolactamization delivered the target compound after deprotection. The chemical shifts of the imidazole hydrogens were strongly dependent on pH, temperature, and concentration. The title compound exhibited modest anticancer activity.

**Natural Product Synthesis I** Mar 24 2020

Protein Ligation and Total Synthesis I Apr 05 2021 Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole. The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed. The coverage is not intended to be an exhaustive summary of the field or include large quantities of data, but should rather be conceptual, concentrating on the methodological thinking that will allow the non-specialist reader to understand the information presented. Contributions also offer an outlook on potential future developments in the field.

*Retrosynthetic Analysis and Synthesis of Natural Products 1* Jan 14 2022 For chemists, attempting to mimic nature by synthesizing complex natural products from raw material is a challenge that is fraught with pitfalls. To tackle this unique but potentially rewarding task, researchers can rely on well-established reactions and methods of practice, or apply their own synthesis methods to verify their potential. Whatever the goal and its complexity, there are multiple ways of achieving it. We must now establish a strategic and effective plan that requires the minimum number of steps, but lends itself to widespread use. This book is structured around the study of a dozen target products (butyrolactone, macrolide, indole compound, cyclobutanic terpene, spiro- and polycyclic derivatives, etc.). For each product, the different disconnections are presented and the associated syntheses are analyzed step by step. The key reactions are described explicitly, followed by diagrams showing the range of impact of certain transformations. This set of data alone is conducive to understanding syntheses and indulging in this difficult, but worthwhile activity.
