*Some Effects of Paraformaldehyde on Wood Surrounding Tapholes in Sugar Maple Trees* Apr 05 2021 S2Pills of paraformaldehyde (trioxymethylene) are commonly used in tapholes in sugar maple trees (*Acer saccharum* Marsh.) to increase the yield of sap collected for making syrup and sugar (2, 4, 5, 8). The explanation offered for this increase in sap yield is that microorganisms in the tapholes (7) cause premature decline and stoppage of the sap flow (1, 6), but that paraformaldehyde increases sap yield by inhibiting their growth (2). But what happens to the tree? To determine the effects of paraformaldehyde on the tissues surrounding tapholes, and on the microorganisms in those tissues, sugar maple trees were dissected and studied. This paper is a report on that study.S3.

*Techniques for the Wheeled-skidder Operator Mar 28 2023 S2*How much production a logger gets from a logging job may depend heavily on his skidder operators. They are key men on any logging job. This is one conclusion that forestry engineers at the USDA Forest Service's Forestry Sciences Laboratory at Morgantown, West Virginia, came to after studying the operation of wheeled skidders in mountainous Appalachian terrain. Out of these studies we can suggest ways that new or experienced skidder operators might improve their operating ability and thus increase their production. This information might also be helpful to logging contractors in training their skidder operators for more efficient production. S3.

*Forestry in the U.S. South Sep 29 2020* During the second half of the twentieth century, the forest industry removed more than 300 billion cubic feet of timber from southern forests. Yet at the same time, partnerships between public and private entities improved the inventory, health, and productivity of this vast and resilient resource. A comprehensive and multilayered history, *Forestry in the U.S. South* explores the remarkable commercial and environmental gains made possible through the collaboration of industry, universities, and other agencies. This authoritative assessment starts by discussing the motives and practices of early lumber companies, which, having exhausted the forests of the Northeast by the turn of the twentieth century, aggressively began to harvest the virgin pine of the South, with production peaking by 1909. By mid-century, however, industrial forestry had its own profit incentive to replenish harvested timber. This set the stage for a unique alliance between public and private sectors,

which conducted cooperative research on tree improvement, fertilization, seedling production, and other practices germane to sustainable forest management. Incomparable in scope, *Forestry in the U.S. South* spotlights the people and organizations responsible for empowering individual forest owners across the region, tripling the production of pine stands, and bolstering the livelihoods of thousands of men and women across the South. -- from back cover.

Tables for Estimating Skidder Tire Wear Aug 21 2022 S2 This book of tables was prepared to help the logging operator estimate how much a particular logging job will wear the tires on his rubber-wheeled skidders. This is an important element in the cost of a logging operation. The logging operator can translate these estimates of tire wear into a production cost. S3.

Factors affecting the production of rubber-tired skidders Feb 15 2022

Functional forms of regression equations were developed for predicting cycle times for rubber-tired skidders in the 70-165 horsepower range. Variables other than volume found to affect skidding times were soil strength, rut depth, slope, segment length, radius of curvature, elevation, horsepower, equipment weight, and skidding distance. Separate equations in English and metric units were derived for board feet, cubic feet, cords, pounds, and load positioning.
