Offering a fresh assessment of the presence and function of paraenesis within Valentinianism, this book places Valentinian moral exhortation within the context of early Christian moral discourse. Like other early Christians, Valentinians were not only interested in ethics, but used moral exhortation to discursively shape social identity. Building on the increasing recognition of ethical and communal concerns reflected in the Nag Hammadi sources, this book advances the discussion by elucidating the social rhetoric within, especially, the "Gospel of Truth" and the "Interpretation of Knowledge." The social function of paraenesis is to persuade an audience through social re-presentation. The authors of these texts discursively position their readers, and themselves, within engaging moments of narrativity. It is hoped that this study will encourage greater integration of research between those working on the Nag Hammadi material and those studying early Christian paraenetic discourse. The goal of this book is to provide an introduction to the practical use of mobile NMR at a level as basic as the operation of a smart phone. Each description follows the same didactic pattern: introduction, basic theory, pulse sequences and parameters, beginners-level measurements, advanced-level measurements, and data processing. Nuclear Magnetic Resonance (NMR) spectroscopy is the most popular method for chemists to analyze molecular structures while Magnetic Resonance Imaging (MRI) is a non-invasive diagnostic tool for medical doctors that provides high-contrast images of biological tissue depicting the brain function and the beating heart. In both applications large super-conducting magnets are employed which magnetize atomic nuclei of an object positioned inside the magnet. Their circulating motion is interrogated by radio-frequency waves. Depending on the operating mode, the frequency spectrum provides the chemist with molecular information, the medical doctor with anatomic images, while the materials scientist is interested in NMR relaxation parameters, which scale with material properties and determine the contrast in magnetic resonance images. Recent advances in magnet technology led to a variety of small permanent magnets, by which NMR spectra, images, and relaxation parameters can be measured with mobile and low-cost instruments.
