They succeeded to the point where the deciphered interplaying of elements and processes paved the way for the revolutionary concept of the petroleum system, a unifying paradigm that plays an important role in decision making associated with oil and gas exploration. The chemistry and physics involved have been addressed in a quantitative way and integrated into the other aspects of petroleum geology, giving rise to the development of numerical basin modeling. This book has been designed to offer an overview of different aspects of the geochemistry of fossil fuels, in particular the functioning of a petroleum system. In this respect, it can be viewed as a foundation for approaching basin modeling. This book will be of interest to a large audience including specialists in the field, nonspecialist professionals, and undergraduate and graduate students. After a century of humiliation, China re-emerged as an independent and sovereign nation following the 1949 Communist victory in the post-WW2 civil war. Chairman Mao Tse-tung said that "the Chinese people (then) comprising one quarter of humanity, have now stood up..." His grand mission, as well as the aspiration of many Chinese, was for China "to become rich and strong" again, which it had been historically for millennia. From a dirt poor country, China's phenomenal progress led to its rise as the world's second largest economy in 2010; its GDP grew from US\$216.8 billion in 1978 to US\$8.2 trillion in 2012. New China has freed over 700 million people from the clutches of extreme poverty -- more than twice the present population of the United States. China's urbanization has also been unparalleled in history -- from 17.9% (180 million urban residents) in 1978 to 51.27% (710 million) by the end of 2012, when its urban population exceeded its rural for the first time in its long history of over 5,000 years. China's previous renaissance occurred during the Northern Song dynasty (960-1126)., about one millennium ago. The present leadership in Beijing has described the "Chinese Dream" as a work in progress over a time span of one century (1949-2049), when China will be completely reconstructed and rejuvenated. The "rise of China" has been named the top news story of the 21st century by the Global Language Monitor. And, it's probably the greatest story ever of the development and transformation of a major nation in the annals of the human race. This study concentrates on the military roots of Soviet policy. It concentrates on how planning for the contingency of a world war shapes and distorts Soviet policy while producing a military posture and structure of forces that appear to the West as being far in excess of any legitimate defense needs. The focus is on the military-technical aspects of doctrine, which is the responsibility of the military to implement. The study does not dwell on the decisions that the Soviet political leaders would face in the course of a war except to note how the hierarchy of objectives would influence those decisions. J. D. Hunley's two-volume work traces the evolution of this technology, from Robert Goddard's research in the 1920s through the development of the Titan missiles and launch vehicles in the 1960s to the refinement of the space shuttle in the 1980s. With the first book devoted primarily to military hardware and the second to launch vehicle hardware, Hunley offers a sweeping overview of these impressive engineering innovations as well as insights into the dynamic personalities responsible for them. Together, the two volumes offer a unique, invaluable history of rocketry that should appeal to a wide range of scholars and space buffs. V.1. U.S. Nuclear forces and capabilities [etc.].
