The papers in this anthology were presented during seven ANTEC and RETEC symposia between 1995 and 1998, and chronicle many of the advances in the plastics coloring technology field during that time span. The unifying theme of the papers is "creating more value." The interactivity of the package design process has continued to demand advances in coloring technology, and the value of being able to exploit product appearance is glaringly apparent. Another way to create value is by being responsive through "Speed to Market." Manufacturers and suppliers have to respond to the demand of their consumers, yet fabricators cannot be ignored in their desire for first run acceptance of color. All these issues and many others are discussed within this authoritative overview of coloring technology.

Hunters are a new breed of criminal. An aberration. Not human, not animal, but a terrifying combination. After a long absence, forensic psychologist Walter Kirino is back with the Hunter Intelligence Division, on the trail of a new Hunter. Following the bodies that the Highway Snatcher leaves behind, Walter is forced to interrogate the question: where is the line between Hunter and human? To find out, he will revisit his traumatic past and throw open the rooms in his mind where his nightmares lay slumbering. The seventh edition, by Charles H. Henrickson, Larry C. Byrd, and Norman W. Hunter of Western Kentucky University, offers clear and concise laboratory experiments to reinforce students' understanding of concepts. Pre-laboratory exercises, questions, and report sheets are coordinated with each experiment to ensure active student involvement and comprehension. An updated student tutorial on graphing with Excel has been added to this edition.

Trey thought he was the only one. It was a lie. The last hereditary werewolf has found his pack – and they're vicious, bloodthirsty, and truly wild. Trey has had enough of vampires, demons and sorcerors. He needs to get in touch with his real family – the ones with fur, fangs and killer instincts. But the wolf pack howling at the moon in Canada is not what he expected. And without the protection of de-fanged vampire and demon-hunter Lucien Charron, the family secret is more dangerous than he ever knew. Trey's out of control. Can the werewolf be tamed? In *Trying Biology*, Adam R. Shapiro convincingly dispels many conventional assumptions about the 1925 Scopes "monkey" trial. Most view it as an event driven primarily by a conflict between science and religion. Countering this, Shapiro shows the importance of timing: the Scopes trial occurred at a crucial moment in the history of biology textbook publishing, education reform in Tennessee, and

progressive school reform across the country. He places the trial in this broad context—alongside American Protestant antievolution sentiment—and in doing so sheds new light on the trial and the historical relationship of science and religion in America. For the first time we see how religious objections to evolution became a prevailing concern to the American textbook industry even before the Scopes trial began. Shapiro explores both the development of biology textbooks leading up to the trial and the ways in which the textbook industry created new books and presented them as “responses” to the trial. Today, the controversy continues over textbook warning labels, making Shapiro’s study—particularly as it plays out in one of America’s most famous trials—an original contribution to a timely discussion. This set of exercises has been created expressly for students and teachers of conservation biology and wildlife management who want to have an impact beyond the classroom. The book presents a set of 32 exercises that are primarily new and greatly revised versions from the book's successful first edition. These exercises span a wide range of conservation issues: genetic analysis, population biology and management, taxonomy, ecosystem management, land use planning, the public policy process and more. All exercises discuss how to take what has been learned and apply it to practical, real-world issues. Accompanied by a detailed instructor’s manual and a student website with software and support materials, the book is ideal for use in the field, lab, or classroom. Presenting experiments that can be completed, in many To the surprise of most Mac fans, the number one bestselling Macintosh software is Microsoft Office for the Macintosh. It's by far the most popular Macintosh software, and the first software purchase a new Mac user is likely to make. And for the first time, Office 2001 comes without a single page of printed instructions. The packaging is a five- inch-square clear plastic case housing the CD-ROM and little else. Fortunately, Pogue Press/O'Reilly is once again ready to embrace the

befuddled and overwhelmed--with Office 2001 for Macintosh: The Missing Manual. It tackles each of the primary Office applications with depth, humor, and clarity, and provides relief for the hapless Mac user who'd rather read professionally written printed instructions than hunt through a maze of personality-free help screens. The book is structured to help the beginner as well as the seasoned user. Part One provides an overview of Word. From "What's New," to "Basic Word Processing," to "Document Design," to "Advanced Word Processing"--with in-depth details on creating Web pages and performing mail merges using Word. Part Two covers the new Palm-syncable calendar in Entourage, including all aspects of email, how to best use the calendar and address book, and crucial information on the Palm Hotsync. Part three explains all the finer points of Excel, including Microsoft's exciting new "List Manager," specifically designed for creating and manipulating lists without the prerequisite of learning spreadsheet tools. Office 2001 for Macintosh: The Missing Manual is coauthored by a dream team of Missing Manual alumni: David Reynolds, executive editor of MacAddict magazine and coauthor of AppleWorks 6: The Missing Manual, and Nan Barber, whose efforts as the copy editor of the first four Missing Manual titles gave her an intuitive feeling for the friendly, funny, authoritative voice of the series. Once again, the authors are joined by series founder David Pogue, who has closely edited the book to ensure excellence of depth, accuracy, and prose. Complete set of test methods including official, provisional, and classical. Careful observation and critical thinking are emphasized in this laboratory manual designed for majors and non-majors. The 18 exercises are appropriate for the introductory biology lab lasting two semesters. Nearly 100 full-color photos have been taken directly from slides and specimens. The color photos enable students to more readily identify structures and organisms studied in the lab. The authors of this lab manual use the textbook, Biology: Life on Earth by Audesirk and Audesirk. The publisher is Prentice-Hall. Other special features include: -- Specific objectives at the beginning of each exercise to help students know what they are expected to accomplish -- Numerous illustrations to clarify instructions and procedures -- Frog dissection for study of vertebrate body systems and anatomy -- Drawings related to the circulatory system in color to clearly identify arteries and veins -- Space for student responses and observations throughout the manual -- Thoroughly class-tested exercises -- Appropriate for use with most textbooks
