From the "Father of Environmental Justice" comes, *Environmental Health and Racial Equity*, a first-rate account of events, individuals, and organizations that have shaped the environmental justice movement over the past two decades. The struggles chronicled are both instructive and inspirational to anyone who wants to make a difference. How should responsibility for adapting to climate change be

distributed? Who should bear the costs of mitigating its impacts and how should these costs be measured? Answers to these questions differ, often according to the vulnerability, wealth and level of industrial development of the country. Finding a fair solution is controversial, but crucial to the complex and vital negotiations over global warming. This volume examines equity concerns in climate change from a broad range of social science disciplines. It explores the policy dimensions and analytical needs of the negotiations process. "This report to the Administrator reviews existing data on the distribution of environmental exposures and risks across population groups. It also summarizes the Workgroup's review of EPA programs with respect to racial minority and low-income populations."--Introduction. This volume looks at the ways in which climate change education relates to broader ideas of justice, equity, and social transformation, and ultimately calls for a rapid response to the need for climate education reform. Highlighting the role of climate change in exacerbating existing societal injustices, this text explores the ethical and social dimensions of climate change education, including identity, agency, and societal structure, and in doing so problematizes climate change education as an equity concern. Chapters present empirical analysis, underpinned by a theoretical framework, and case studies which provide critical insights for the design of learning environments, curricula, and everyday climate change-related learning in schools. This text will benefit researchers, academics, educators, and policymakers with an interest in science education, social justice studies, and environmental sociology more broadly. Those specifically interested in climate education, curriculum studies, and climate adaptation will also benefit from this book. In *On Environmental Governance*, Oran R. Young examines a variety of efforts to meet the challenge of governing human interaction with

the environment in the interest of sustainability. At the same time, he considers measures to minimize restrictions on human actors in using their natural resources. Young looks at issues including climate change, biodiversity, deforestation, greenhouse gas emissions, and carbon cycle disruption in exploring impacts from the local to the global. The book draws on general ideas about the nature of governance while exploring new models for governing human-environment relations. This edited volume outlines the most innovative programs to address environmental challenges and improve the welfare of poor and marginalized populations. Many predict that by the end of the 21st century water will dominate world natural resource politics as oil does today. At present, much of the world's water is misallocated, wasted or polluted. This book argues that fairness in the allocation of water could be the cornerstone to a more secure future for mankind. *Environmental Equity: Reducing Risk for all Communities* This title was first published in 2001. Discussing the implications for the world of embracing - or failing to embrace - international environmental equity, as a core global objective is an essential exercise, which this book undertakes with diligence and vigour. Written in an accessible style, this is essential reading for students of international relations and world politics, global environmental policy and environmental policy and American foreign policy. Environmental activists and academics alike are realizing that a sustainable society must be a just one. Environmental degradation is almost always linked to questions of human equality and quality of life. Throughout the world, those segments of the population that have the least political power and are the most marginalized are selectively victimized by environmental crises. This book argues that social and environmental justice within and between nations should be an integral part of the policies and agreements that promote sustainable development. The book addresses the links between environmental quality and human equality and between sustainability and environmental justice. The smart growth movement aims to combat urban and suburban sprawl by promoting livable communities based on pedestrian scale, diverse populations, and

mixed land use. But, as this book documents, smart growth has largely failed to address issues of social equity and environmental justice. Smart growth sometimes results in gentrification and displacement of low- and moderate-income families in existing neighborhoods, or transportation policies that isolate low-income populations. *Growing Smarter* is one of the few books to view smart growth from an environmental justice perspective, examining the effect of the built environment on access to economic opportunity and quality of life in American cities and metropolitan regions. The contributors to *Growing Smarter*—urban planners, sociologists, economists, educators, lawyers, health professionals, and environmentalists—all place equity at the center of their analyses of "place, space, and race." They consider such topics as the social and environmental effects of sprawl, the relationship between sprawl and concentrated poverty, and community-based regionalism that can link cities and suburbs. They examine specific cases that illustrate opportunities for integrating environmental justice concerns into smart growth efforts, including the dynamics of sprawl in a South Carolina county, the debate over the rebuilding of New Orleans after Hurricane Katrina, and transportation-related pollution in Northern Manhattan. *Growing Smarter* illuminates the growing racial and class divisions in metropolitan areas today—and suggests workable strategies to address them. *Climate Change and Cities* bridges science-to-action for climate change adaptation and mitigation efforts in cities around the world. "This report to the Administrator reviews existing data on the distribution of environmental exposures and risks across population groups. It also summarizes the Workgroup's review of EPA programs with respect to racial minority and low-income populations."--Introd. "Greenhouse gas emissions are widely considered to be the ultimate environmental externality and consequently a topic of great contemporary concern. This treatment of the important issues will be welcomed by climate change negotiators, policymakers, and economic, environmental and social researchers. It will also be of interest to anyone who believes that the negotiation process may benefit from a more deep-rooted

shift in social attitudes and beliefs."--BOOK JACKET. Heritage occupies a privileged position within the built environment. Most municipalities in the United States, and nearly all countries around the world, have laws and policies to preserve heritage in situ, seeking to protect places from physical loss and the forces of change. That privilege, however, is increasingly being unsettled by the legacies of racial, economic, and social injustice in both the built environment and historic preservation policy, and by the compounding climate crisis. Though many heritage projects and practitioners are confronting injustice and climate in innovative ways, systemic change requires looking beyond the formal and material dimensions of place and to the processes and outcomes of preservation policy--operationalized through laws and guidelines, regulatory processes, and institutions--across time and socio-geographic scales, and in relation to the publics they are intended to serve. This third volume in the Issues in Preservation Policy series examines historic preservation as an enterprise of ideas, methods, institutions, and practices that must reorient toward a new horizon, one in which equity and sustainability become critical guideposts for policy evolution. This book explores the capacity of different stakeholders to work together and build urban resilience to climate change through an equity-centered approach to cross-sectoral collaboration. Urban areas, where the majority of the global population dwells, are particularly vulnerable to a myriad of climate stressors, the effects of which are acutely present in places and to communities that have been largely excluded from decision-making processes. Our need for working and learning together is at a critical threshold, yet at present, the process for and understanding of inter-sectoral collaborations remains a theoretical ideal and falls short of the broad appeal that many have claimed. Collaborating for Climate Equity argues that researcher-practitioner partnerships offer a promising pathway toward ensuring equitable outcomes while building climate resilience. By presenting five case studies from the United States, Chile, and Mexico, each chapter explores the contours of developing robust researcher-practitioner collaborations that

endure and span institutional boundaries. The case studies included in the book are augmented by a synthesis that reflects upon the key findings and offers generalizable principles for applying similar approaches to other cities across the globe. This work contributes to a nascent knowledge base on the real-world challenges and opportunities associated with researcher-practitioner partnerships. It provides guidance to academics and practitioners involved in collaborative research, planning, and policymaking. The American West faces many challenges, but none is more important than the challenge of managing its water. This book examines the role that water transfers can play in allocating the region's scarce water resources. It focuses on the variety of third parties, including Native Americans, Hispanic communities, rural communities, and the environment, that can sometimes be harmed when water is moved. The committee presents recommendations to guide states, tribes, and federal agencies toward better regulation. Seven in-depth case studies are presented: Nevada's Carson-Truckee basin, the Colorado Front Range, northern New Mexico, Washington's Yakima River basin, central Arizona, and the Central and Imperial valleys in California. Water Transfers in the West presents background and current information on factors that have encouraged water transfers, typical types of transfers, and their potential negative effects. The book highlights the benefits that water transfers can bring but notes the need for more third-party representation in the processes used to evaluate planned transfers. "This report to the Administrator reviews existing data on the distribution of environmental exposures and risks across population groups. It also summarizes the Workgroup's review of EPA programs with respect to racial minority and low-income populations."--Introd. In light of the power strategies in play in the new geopolitics of economic and ecological globalization, there is need for critical analysis of how the agenda of sustainable development is being conceived, shaped, and implemented. This volume considers issues of equity and development in the US-Mexico border region?and highlights the fact that regions at the juncture of the industrial and developing worlds most clearly illustrate the

problems inherent in current economic paradigms. Jane Clough-Riquelme is a regional planner with the San Diego Association of Governments (SANDAG). Her work focuses on borders planning, including tribal liaison and binational and interregional planning with neighboring jurisdictions. Nora L. Bringas Rabago is research professor in the Department of Urban and Environmental Studies, El Colegio de la Frontera Norte, in Tijuana.

Radical both in its critique of the causes of environmental crisis in India and in its proposal for ecological reform, this book reveals the interconnections of social and environmental conflict and makes for

essential reading. Economics, Equity, and the Environment examines major economic incentive and market-based environmental protection programs that are being implemented by governments, including pollution taxes, pollutant trading programs, regulatory waiver programs, subsidies, grants, loans and favorable tax treatment, and deposit/refund systems. It examines the advantages and disadvantages of each program, with special emphasis on the environmental justice impacts of the programs. Additional chapters in the book examine information disclosure laws, pollution prevention, and cost-benefit analysis, as each of those tools plays a vital role in market-based environmental protection and environmental justice concerns. Economics, Equity, and the Environment is ideally suited for use in environmental law seminars, courses that deal with environmental justice, survey courses, economics and administrative law courses, and environmental law courses in business schools. Each chapter of the book has a theoretical, as well as practical, component, making this book to be of considerable assistance to attorneys in private practice and policymakers. Markets are increasingly central to the resolution of environmental problems. They played a critical role in implementing the 1990 Clean Air Act of the United States, which has been instrumental in reducing acid rain in a cost-effective manner. They are also central to the global strategy adopted for limiting the emissions of greenhouse gases under the 1997 Kyoto Protocol and are being used for resolving conflicts over the use of other environmental resources, particularly water. Environmental Markets: Equity and Efficiency represents the first systematic and in-depth study of the economic issues raised by this growing use of environmental markets. Focusing on the relationship between equity and efficiency—which is central to many of the debates between industrial and developing countries—the book explores the underlying economics and the possibilities for win-win solutions that benefit all parties to the problems. Graciela Chichilnisky and Geoffrey Heal have been instrumental in developing the economic understanding required for the operation of environmental markets and for promoting their use among policy makers leading to the Kyoto

Protocol. Contributors to this volume include established experts from international organizations, nongovernmental organizations, and academia, including Raúl Estrada-Oyuela, who chaired the negotiating committee of the Framework Convention on Climate Change and the 1997 Kyoto meetings. A research annual. Traditional transport planning has generated transport systems that propagate an unfair distribution of accessibility and have environmental and safety issues. This book highlights the importance of social and political aspects of transport policy and provides a methodology to support this approach. It emphasizes the importance of co-ordinating urban, transport and traffic planning, and addresses the major challenge of modifying the building and use of roads. The author makes suggestions for innovative and radical new measures towards an equitable and sustainable urban environment. The near-unanimous consensus among climate scientists is that the massive burning of gas, oil, and coal is having cataclysmic impacts on our atmosphere and climate. These climate and environmental impacts are particularly magnified and debilitating for low-income communities and communities of color. Energy democracy tenders a response and joins the environmental and climate movement with broader movements for social and economic change in this country and around the world. Energy Democracy brings together racial, cultural, and generational perspectives to show what an alternative, democratized energy future can look like. The book will inspire others to take up the struggle to build the energy democracy movement. This unique and insightful text offers an exploration of the origins and subsequent development of the concept of just sustainability. Introducing Just Sustainabilities discusses key topics, such as food justice, sovereignty and urban agriculture; community, space, place(making) and spatial justice; the democratization of our streets and public spaces; how to create culturally inclusive spaces; intercultural cities and social inclusion; green-collar jobs and the just transition; and alternative economic models, such as co-production. With a specific focus on solutions-oriented policy and planning initiatives that specifically address issues of equity and

justice within the context of developing sustainable communities, this is the essential introduction to just sustainabilities. A public health approach to the US food system Introduction to the US Food System: Public Health, Environment, and Equity is a comprehensive and engaging textbook that offers students an overview of today's US food system, with particular focus on the food system's interrelationships with public health, the environment, equity, and society. Using a classroom-friendly approach, the text covers the core content of the food system and provides evidence-based perspectives reflecting the tremendous breadth of issues and ideas important to understanding today's US food system. The book is rich with illustrative examples, case studies, activities, and discussion questions. The textbook is a project of the Johns Hopkins Center for a Livable Future (CLF), and builds upon the Center's educational mission to examine the complex interrelationships between diet, food production, environment, and human health to advance an ecological perspective in reducing threats to the health of the public, and to promote policies that protect health, the global environment, and the ability to sustain life for future generations. Issues covered in Introduction to the US Food System include food insecurity, social justice, community and worker health concerns, food marketing, nutrition, resource depletion, and ecological degradation. Presents concepts on the foundations of the US food system, crop production, food system economics, processing and packaging, consumption and overconsumption, and the environmental impacts of food Examines the political factors that influence food and how it is produced Ideal for students and professionals in many fields, including public health, nutritional science, nursing, medicine, environment, policy, business, and social science, among others Introduction to the US Food System presents a broad view of today's US food system in all its complexity and provides opportunities for students to examine the food system's stickiest problems and think critically about solutions. Forever Chemicals: Environmental, Economic, and Social Equity Concerns with PFAS in the Environment provides the reader with an understanding of the complex and interwoven

issues associated with per- and polyfluorinated substances (PFAS) in our environment. The chapters provide in-depth perspective into various issues, including health, regulation, detection, clean-up strategies and technologies, and more. Taken together or as the reader's interests lead them, the variety of topics covered in the book present a balanced perspective on this complex topic. It will address the current state of PFAS and where indicators are pointing for future developments. The book is also a deeper investigation of the regulatory challenges, analytical hurdles, and toxicological progress to date for the suite of PFAS chemicals. Features Explains the trends that will affect future policy and regulatory decisions Looks holistically at 4000+ PFAS chemicals Includes PFAS risk assessments at contaminated sites and biomonitoring insights Provides in-depth discussions on remediation technologies Illustrates quality and diversified content Provides a balanced perspective on this complex topic Developing countries need to design projects to increase the growth and wellness of its human population, which involves the inclusion of topics associated directly with the sustainable development of these countries and their particular social problems. This book examines the interrelations between development, growth, the environment and inequality, especially in developing countries and taking into account qualitative and quantitative approaches. Increasing welfare of the population is important to the increase of human development through the improvement of developmental and environmental conditions, generating sustainable development where it is key to seek changes in public policies, economic, technological and social factors. This book aims to analyse different contexts from micro to macro level relationships between development, growth, inequality, environment and human development, and evaluate what the actual conditions in emerging economies are and how developing new strategies could improve the well-being of developing countries. The book is organised as follows: Saiz-Alvarez and Gamez identify the main components to propose an entrepreneurship model that includes distance, education, and information and communication technologies (ICTs) as alternatives to generate

wealth and development in developing countries. In Chapter Two, Cutolo et al. describes an approach to current situations of water vulnerability in watersheds of metropolitan regions in tropical countries of South America, and the importance to improve the strategies to promote environmental health in these regions. In Chapter Three, Hashim shows a comparison from a historical point of view between two crops, one of them native to South America (quinoa) and the other from Africa (pearl millet). The comparison leads to the questions of whether or not reflexions consider pearl millet as an alternative to food security in African countries and as an incentive for women farmers. In Chapter Four, Palmer and Correa applied three groundwater indicators: a groundwater extraction indicator, a groundwater extraction for public supply per capita indicator and a groundwater vulnerability indicator to describe the different characteristics of the environment and propose this analysis as a tool to make decisions in environmental management within the Cove Basin at the Island of San Andrés (Colombia). Correa in Chapter Five analyses and assesses the impact that poverty and access to water have on labor productivity of the economically active population in Colombia. In Chapter Six, Daronco and Wartchow clarify how the Brazilian policies about water resources have been based on the laws developed at the time of discovery in 1500. Additionally, it regards the culminating active level in the National Water Resources System (NWRS) today. Finally, Castellanos conducts a search and reflection of bioethical dilemmas in veterinary medicine, identifying sources of stress and coping strategies in Chapter Seven. While major strides have been made in the scientific understanding of climate change, much less understood is how these dynamics in the physical environment interact with socioeconomic systems. This book brings together the latest knowledge on the consequences of climate change for society and how best to address them. Investing for future. Sustainable investment and resource use. Concepts, conditions and principles. Some economic, ecological and social concepts: underlying assumptions. Necessary conditions and policy principles for sustainable resource

use and investment. Opportunities for change. The design of resource-right systems: allocating opportunities for sustainable investment and resource use. Building a sustainable economy: macro-economic policy opportunities. At a time of impending demographic shifts, faculty and administrators in higher education around the world are becoming aware of the need to address the systemic practices and barriers that contribute to inequitable educational outcomes of racially and ethnically diverse students. Focusing on the higher education learning environment, this volume illuminates the global relevance of critical and inclusive pedagogies (CIP), and demonstrates how their application can transform the teaching and learning process and promote more equitable educational outcomes among all students, but especially racially minoritized students. The examples in this book illustrate the importance of recognizing the detrimental impact of dominant ideologies, of evaluating who is being included in and excluded from the learning process, and paying attention to when teaching fails to consider students' varying social, psychological, physical and/or emotional needs. This edited volume brings CIP into the realm of comparative education by gathering scholars from across academic disciplines and countries to explore how these pedagogies not only promote deep learning among students, but also better equip instructors to attend to the needs of diverse students by prioritizing their intellectual and social development; creating identity affirming learning environments that foster high expectations; recognizing the value of the cultural and national differences that learners bring to the educational experience; and engaging the "whole" student in the teaching and learning process.
