This paper is designed as a statistical guide for determining the equivalency of two chemical test methods. A variety of tests are performed on the data which is obtained by two methods: (a) Method 1 is the specified method that has been referred to in the specification; and (b) Method 2 is the proposed method which is being compared to the specified method to determine if it is equivalent or not. The term equivalency must be defined for this paper. In general the equivalency of two test methods implies that the methods have the same accuracy and the same precision. This is the only case in which the two test methods may be deemed equivalent. If method 1 is more or less accurate or precise than method 2, then the methods are not equivalent. This guide is divided into four parts. The first two parts represent data which must be gathered and treated by the proponent of the new test method. The results obtained in this section will provide guidance as to whether a round robin should even be performed. If the results obtained in the first two parts indicate that the proposed test method may be an equivalent method, then the round robin should be organized and the data obtained for treatment in Parts 3 and 4.

Proceedings of ASM International's 1993 Conference. In this volume, the papers describe real-world applications of putting composites to work. Once thought of as solutions in search of problems, many of these composites are being mainstreamed into commercial applications. Nearly one-third of the book deals with physical and mechanical properties of ceramic matrix composites; other areas covered in detail are processing and characterization of intermetallic matrix composites and metal matrix composites; processing, fabrication and application of polymer matrix composites, fabrications of functionally gradient materials, and processing applications of carbon-carbon composites. Contributing authors hail from university, government and defense research facilities, as well as from aerospace companies across the country. Fully revised and updated third edition

The phenomenon that makes machines such as computers or mobile phones see the surroundings is known as Computer Vision. Serious work on re-creating a human eye started way back in 50s and since then, we have come a long way. Computer vision has already made its way to our mobile phone via different e-commerce or camera apps. Think of what more can be done by machine when they will be able to see as accurate as a human eye. Human eye is a complex structure and it goes through more complex phenomenon of understanding the environment. In a similar fashion, making machines see things and make them capable enough to figure out what they are seeing and further categorize it, is still a pretty tough job. Working on Computer Vision is equivalent to working on millions of calculations in the blink of an eye

with almost same accuracy as that of a human eye. It is not just about converting a picture into pixels, and then try to make sense of what's in the picture through those pixels, you will have to first understand the bigger picture of how to extract information from those pixels and understand what they represent This latest edition incorporates the many changes in the specifications and designations of nonferrous alloys that have occurred over the past five years. The volume features over 20,000 alloy designations, including a complete listing of UNS designations for nonferrous alloys and comprehensive treatment of current European and Japanese standards. It covers more countries, more alloys, and more standards than previous editions, while keeping obsolete designations for those persons trying to duplicate equipment from old documents. This comprehensive volume is well-indexed with easy-to-use cross references that make short work of looking up equivalents for a material specification or designation. It provides valuable composition tables that allow you to compare similar alloys. Tensile properties and product forms are provided when available.
